ABSTRACT OF THE DISCLOSURE

A plurality of devices for reading document images
are connected through a network. A master device and
slave devices are set among the devices. Read condi-
tions and image forming conditions are respectively
notified to the slave devices by the master device.
Each slave device reads an original document based on
the read condition, and outputs the read image data
attached with the image forming condition, to the print
device. The print device prints image data from
various read devices under the image forming conditions
attached thereto, thereby to print image data from the
plurality of read devices, integrated with each other.
